

S&P 500® Dynamic Intraday TCA Index

Comparative Index Crediting Examples

The table below illustrates the historical performance of a single crediting strategy across multiple crediting rate scenarios. It provides insight into how the strategy would have performed in different market environments, including best and worst 10 year periods, as well as recent performance across shorter time horizons.

These examples are intended for context only. Current crediting rates and future results may vary.

Average Growth Rates Using a standardized 20-year year-end lookback period ending December 31, 2025							
Crediting Strategy	Crediting Rate Examples	Best 10 Years	Worst 10 Years	Last 10 Years	Last 5 Years	Last 3 Years	Last Year
S&P 500® Dynamic Intraday TCA Index Point- to-Point Cap	8.00%	6.15%	5.34%	6.04%	5.72%	6.94%	4.84%
	10.00%	7.53%	6.51%	7.41%	6.89%	8.25%	4.84%
	12.00%	8.76%	7.53%	8.64%	8.05%	9.56%	4.84%
	14.00%	9.92%	8.49%	9.80%	9.21%	10.86%	4.84%

How The S&P 500 Price Return Index Works

- ▶ The index is linked to the S&P 500, while actively adjusting exposure throughout the day.
- ▶ It monitors market volatility and trading conditions in real time.
- ▶ When markets are calm, the index can keep more exposure to stocks.
- ▶ As markets become riskier, it automatically reduces exposure to help manage risk.
- ▶ These adjustments happen according to pre-set, rules-based formulas, not human judgment.

In simple terms:

This index actively manages risk by adjusting exposure—scaling up in stable markets and dialing back during periods of higher volatility.

It is important to consult with a financial professional when diversifying across crediting strategies that could align with financial goals, risk tolerance levels, and time horizons.

Indices that do not have at least 10 years of actual performance history cannot be illustrated in all states. All information for an index prior to its Launch Date is hypothetical back-tested, not actual performance, and based on the index methodology in effect on the Launch Date. Back-testing is a method of demonstrating how an index may have performed in the past based on how it has performed recently. It is used to produce hypothetical results for a specific period when results are otherwise unknown or not available. Back-tested performance reflects application of an index methodology and selection of index constituents with the benefit of hindsight and knowledge of factors that may have positively affected its performance, cannot account for all financial risk that may affect results and may be considered to reflect survivor/look ahead bias.

The calculations used assume static crediting rates and do not include a bonus or withdrawals. Non-guaranteed cap and par rates may change each contract year and may create better or worse performance than shown here. The range of crediting rates shown above may be different than current crediting rates. This flyer is updated on an annual basis. Refer to the Interest Rate Bulletin for current rates and to the Crediting Options Guide for more details about each index.
